PROFESSIONAL SUMMARY

Technical designer and gameplay scripter with seven years building multiplayer gameplay systems on DayZ, the last two leading a project end to end. Works across Enforce Script, server-authoritative gameplay systems, data-driven player customization, persistent identity, progression and economy, level design, asset integration, and hands-on QA. Comfortable owning a feature from concept through implementation, testing, and player-facing iteration.

EXPERIENCE

Lead Developer / Technical Designer - Metro W.A.R. RP

Independent DayZ project | 2024-Present | Two-person team

- Lead development across gameplay scripting, technical design, model integration, game design, multiplayer economy, and QA; collaborate with a second developer who focuses on world and map production.
- Designed and implemented a data-driven character loadout system with real-time preview, persistent profile rules, and server-side eligibility validation.
- Built synchronized interactive world systems: power networks, switches, lighting circuits, control panels, powered doors, and the player feedback around them.
- Developed persistent player identity, in-game economy, access control, private storage, roleplay character cards, and progression systems.
- Built a radiation layer: contaminated zones with safe-zone overrides, consumable gas-mask filters, and staged unconsciousness and death that reverses once protected, with the in-game wristwatch repurposed into a filter countdown.
- Built a sanity system: psychic pressure scaled by distance, view angle and line of sight, resistance earned through kills, and escalating loss of control as sanity falls. Client state syncs only past a change threshold to keep bandwidth down.
- Implemented radio voice comms over the engine's proximity VOIP: a server-side router recomputes a per-pair mute matrix each tick from position, voice level, tuned frequency and radio state, so players hear each other directly, on a matching channel, or through a radio left on speaker.
- Built a rideable rail vehicle for multiplayer, covering physics tuning, multi-passenger support, custom track layouts, and automatic alignment to valid track nodes.
- Contributed level design across underground and surface environments, shaping onboarding, exploration routes, economy touchpoints, atmosphere, and encounter flow.
- Own QA alongside development: reproduce issues, trace client-server failures, validate configuration edge cases, and iterate through multiplayer playtests and player feedback.

PROJECT IMPACT 2 years in development | 900+ community members | Full 80-player server during the latest major test | Closed beta in preparation

Gameplay Scripter - S.T.A.L.K.E.R. RP

Independent DayZ project | 2019-2024

- Owned the gameplay scripting for a persistent roleplay server, implementing the project's custom mechanics in Enforce Script.
- Reached 300+ community members and ran at the full 80-player server capacity before the project was wound down.

SKILLS

Programming: Gameplay scripting (Enforce Script); client-server architecture and RPC; data persistence; config-driven systems; debugging

Game development: Technical design; gameplay systems; multiplayer design; game economy; level design; onboarding; hands-on QA

Tools: DayZ Tools; Object Builder; Terrain Builder; Blender; Substance Painter; Adobe Photoshop

EDUCATION

Tallinn Polytechnic School (Tallinna Polütehnikum) - IT Specialist

LANGUAGES

Russian - Native | English - Professional working proficiency | Estonian - Basic
